

Nigeria: road crash patterns

Power BI | FRSC / Q4 2020 to Q4 2021

Business question

Which recorded factors and vehicle groups warrant closer road-safety attention? The published project covers Federal Road Safety Commission data from Q4 2020 through Q4 2021.

Approach

The Power BI dashboard compares quarter-year periods, reported causative factors, states, vehicle categories and demographic groups. This write-up interprets the published static visual and keeps crash cases, casualties and deaths as separate measures.

What the dashboard shows

Headline cards display approximately 16K cases, 56K casualties and 8K killed. Speed violation is the largest recorded factor, at about 11.1K in its chart. Commercial vehicles account for about 65.8% of the vehicle-category breakdown. Adult males form the largest group in the demographic chart.

Recommended decisions

Prioritize a closer review of speeding-related records and commercial-fleet safety practices. Compare individual quarter-year periods to locate peaks before planning campaigns. Combine state counts with traffic exposure and consistent reporting coverage before allocating resources. Track subsequent changes with clearly defined crash and casualty measures.

Interpretation limits

The 56K headline is labelled Casualty, not crash incidents. The 14.36% Fatality card is not used as a population fatality rate because its denominator is not documented. Recorded factors may overlap and do not prove a single causal mechanism. The window includes two fourth quarters; pooling both against one of each other quarter would distort seasonality. Vehicle-category percentages do not measure the risk per journey.
